

DUG

Decentralized Underwriting Group

Build Session Summary

May 4, 2026 | Prepared for Ben Volkmer

This document summarizes all platform changes, database migrations, new features, and strategic documents produced in the current build session. Everything described here has been built and pushed to GitHub unless otherwise noted.

1. Engagement Tier & Fee System

We implemented a server-side engagement tier system that automatically classifies every job posting by requester type and applies the corresponding platform fee. The tier is derived in actions.ts — requesters never set it manually. A color-coded tier badge on the post-job form shows the classification in real time.

Tier	Who	Platform Fee	Note
Consumer	Individual / personal lines	20%	Advisory cap applies
Professional	Broker, agent, risk mgr, commercial insured, tech/AI	15%	Broadest segment
Enterprise	Carrier, MGA, reinsurer	10%	SLA selector unlocked
Strategic	Partners (future)	7.5%	Partner-sourced jobs

Both engagement_tier and platform_fee_bps are persisted on every job row in Supabase.

2. Database Migrations

The following columns were added to the jobs table in Supabase:

- engagement_tier — text, NOT NULL, DEFAULT 'professional' (consumer | professional | enterprise | strategic)
- platform_fee_bps — integer, NOT NULL, DEFAULT 1500. Fee in basis points.
- sla_hours — integer, nullable. Allowed: 24, 48, 72, 168. Enterprise requesters only.

- acquisition_source — text, nullable. Reserved for partner-sourced jobs (e.g. 'national_alliance').
- find_bounty_cents — integer, nullable. Per-confirmed-find bounty for portfolio audit swarm jobs.
- milestones — JSONB, nullable. Array of {label, amount_cents, status} objects.

A new revenue_events table was also created:

- id, created_at, job_id (FK → jobs)
- event_type — CHECK (job_posted | work_accepted | milestone_released | bounty_paid | platform_fee_collected)
- engagement_tier, gross_amount_cents, platform_fee_cents, platform_fee_bps, acquisition_source, requester_type, notes

RLS is enabled with a no_public_access policy. This table is the foundation for the platform revenue analytics dashboard.

3. New Budget Models

The platform now supports five budget types, up from the original three. The two new models cover the full spectrum from high-volume microtask work to high-value program design.

Model	Best for	Stored as	Platform cut
Flat fee	Advisory reviews, audits	budget_cents	On payout
Hourly	Open-ended consults	budget_cents (cap)	On payout
Per-find bounty	Portfolio audit swarms	find_bounty_cents + pool cap	Per bounty payout
Milestone	Program design, high-value	milestones JSONB [{label, amount_cents, status}]	Per milestone release
Volunteer	Portfolio / community work	0 cents	None

3a. Per-Find Bounty (Portfolio Audit Swarms)

Designed for large-scale portfolio audits where carriers or MGAs want many underwriters reviewing many submissions simultaneously. A new portfolio_audit job type was added — available only to carrier, MGA, and reinsurer requesters.

- Requester sets a bounty per confirmed find (\$1–\$500 range)
- Optional total pool cap limits overall exposure
- Gamification mechanics: leaderboard, streak bonuses, speed multipliers (revenue model doc)

- Platform fee applies per bounty payout, not as a lump upfront commitment
- `find_bounty_cents` stored on job row; `budget_cents` used for the optional pool cap

Economics example: A carrier with 1,000 submissions at \$8/find and a \$2,000 pool cap gets up to 250 confirmed findings — well within the economics of traditional audit costs at a fraction of the time.

3b. Milestone Billing (High-Value Program Design)

Top-end engagements — program design and complex advisory work that can justify rates comparable to specialized consulting. No rate cap. Requesters define up to five payment gates.

- Up to 5 milestones per engagement, each with a label and dollar amount
- Persisted as JSONB array [{label, amount_cents, status: 'pending'}]
- Total displayed as a running sum in the post-job form
- Platform fee deducted at each milestone release, not upfront
- E&O trigger recommended at this level — future enforcement, not a current blocker

4. Post-Job Form Enhancements

Tier Badge

A color-coded badge appears below the requester type selector showing the tier and platform fee in real time. Updates automatically on requester change.

SLA Selector

Enterprise requesters (carrier, MGA, reinsurer) see a turnaround commitment dropdown: 24-hour, 48-hour, 72-hour, 7-day, or best-effort. Stored in `sla_hours`.

Per-Find Bounty UI

When budget type = `per_find`, an amber-tinted card appears with a bounty-per-find input (\$1–\$500), an optional total pool cap input, and a live platform fee reminder.

Milestone Builder UI

When budget type = `milestone`, an indigo-tinted card appears with up to 5 label+amount rows, add/remove controls, a running total display, and automatic `milestones_json` serialization on submit. `handleReset()` clears all milestone state back to defaults.

Job Type Labels

Both the jobs board and the job detail page were updated with the `portfolio_audit` label and a complete set of all current job type labels.

5. /pricing Page

A new /pricing route was built with four tier cards (Consumer, Professional, Enterprise, Strategic), a four-step 'How it works' flow, and a six-question FAQ. Pricing was added to the site footer alongside the previously added Why humans → and Trust & accountability links.

6. Partnership Outreach Framework

A standalone Word document — DUG_Partnership_Outreach_Framework.docx — was written and saved to the /docs folder. It covers five priority education and trade partners:

- The Institutes (CPCU, ARM) — credential verification + CE pathway
- National Alliance (CIC, CISR) — practical training alignment
- IEA (Insurance Education Association) — regional CE provider approval
- PLUS (Professional Liability Underwriting Society) — specialty market entry
- RIMS (Risk & Insurance Management Society) — risk manager demand-side

For each partner the document includes audience, engagement priority, what DUG offers vs. what it asks for, and a ready-to-send email template. A long-term Embedded E&O roadmap with a five-stage build timeline is also included.

Strategic posture: DUG does not compete with education providers. It creates a verified practice layer and peer community on top of their credentials. The ask is lightweight — data sharing and co-marketing, not deep integration.

7. Revenue Model Document Updates

The primary strategy document (DUG - Revenue Model & Embedded Products Strategy.docx) received two major additions:

Part 3 (new) — Underwriting Assessment & Interview Platform

Covers the market gap in underwriting talent evaluation, the Live Interview Sandbox concept (analogous to LeetCode for developers), and the Assessment Library and Benchmark Moat strategy. Includes a four-phase build roadmap from MVP text cases through certification integration and per-assessment licensing.

Extended Budget Models Section

Per-find bounty and milestone billing mechanics, carrier economics, storage schema, and the platform philosophy on leakage:

Leakage is a feature. If carriers are poaching DUG community members directly, that is proof of value — not a failure of controls. DUG's moat is community depth and volume, not lock-in.

8. GitHub & Deployment Status

All platform code changes were pushed to TheJimmyJam/DUG via the GitHub REST API. Files updated:

- `src/app/post-job/actions.ts` — tier logic, fee map, milestone parsing, `per_find` budgets
- `src/app/post-job/post-job-form.tsx` — tier badge, SLA selector, `per_find` + milestone UIs
- `src/app/jobs/jobs-board.tsx` — `portfolio_audit` label
- `src/app/jobs/[id]/page.tsx` — full `JOB_TYPE_LABEL` map
- `src/app/pricing/page.tsx` — new `/pricing` route
- `src/components/site-footer.tsx` — Pricing + manifesto + trust links

Netlify auto-deploys on push to main. Live site:

<https://decentralizedunderwritinggroup.netlify.app>

9. Suggested Next Priorities

Based on the current build state, the highest-value next steps are:

- **Job detail page — display `find_bounty_cents` and milestones JSONB in the UI for both requesters and underwriters**
- Claim flow — wire milestone status updates (`pending` → `in_progress` → `complete`) to trigger payout events in `revenue_events`
- Portfolio audit swarm — build the leaderboard view and per-find submission interface (underwriter side)
- Revenue dashboard — admin view querying `revenue_events` for gross volume, fees collected, and tier breakdown
- Partner outreach — initiate contact with The Institutes using the email template in the outreach framework doc
- Assessment platform MVP — first text-only underwriting case with scoring rubric, targeting carrier HR
